

ALKUS SOLID PLASTIC FORMWORK PANELS

Alkus panels are solid plastic formwork panels made from aluminium reinforced polypropylene that are typically used for wall formwork and special structural elements because of its excellent flexural strength.

Alkus solid plastic panels enable perfect element joints and excellent concrete surfaces corresponding to exposed concrete classifications resulting in top quality finishes with no surface irregularities/ripples time after time.

Due to its longevity, Alkus panels are able to provide one of the most economic solutions for use in concrete construction as they can last up to 20 times longer than timber facing.
